Preface

About 30 years ago, the first Japanese pioneer research project was started at NIRS on plutonium-hazards as corresponding to increasing concerns about the risk assessment and radiation protection for plutonium compounds associated closely with the development of fast breeder reactor and plutonium recycling procedures in Japan. This research project conducted by Dr.H.Eto was commenced in April 1966, completed in March 1970, and thereafter, in the last part of 1970s, was again proposed by the then Japan Atomic Energy Committee to process the new research project on the biological effects of plutonium compounds, which needed the establishment of the first and unique research facility available for long-term animal experiments using variable species including beagle dogs, radioprotection for the usage of plutonium compounds and nuclear security. The research project organized by Dr.O.Matsuoka was initiated from 1980, while the new research facility including the disposal plant was finally completed in 1988. Then actual experimental studies including inhalation exposures of animals to plutonium oxide aerosols was started by coordination of Dr.J.Inaba from 1990, and a lot of results were obtained during the recent decade of 1990 - 2000 concerning the development for aerosol generation and assessment, biokinetics and metabolic behaviors of internally deposited plutonium, the development for whole-body counting and microdosimetry of plutonium distributed in the lung, the risk for pulmonary and bone carcinogenesis after inhalation or injection of plutonium compounds, and decorporation and resultant risk mitigation of contaminated plutonium in the body. However, our life-span studies on carcinogenesis particularly at lower dose ranges as well as molecular mechanisms leading to carcinogenesis have continued from 2001 to finally complete and summarize experimental data needed for the risk assessment and complement to guidelines for radiation protection.

The idea for a kind of archives to summarize and review of the above described results, particularly those on carcinogenesis, was naturally originated in the process of arrangements of individual animal data from experimental studies by the request of Dr.G.B.Gerber who took our data into account for the data base of European Radiobiology Archives, and strongly inspired to make the outlines more clear by the book, "Life-Span Effects of Ionizing Radiation in the Beagle Dog, edit. R.C.Thompson, PNL" which was given in Sendai on the occasion of the annual meeting for radiation research society by Dr.C.R.Watson, PNL. Now, we are obliged to establish the archives to review the outlines of all the experimental studies and summarize each of individual animal data on plutonium-induced carcinogenesis as a memorial that we have certainly been engaged in such a unique research project in Japan for almost two decades, and further to list up as many the preserved specimens as possible, including paraffin-embedded tissue blocks and histological slides or microscopic pictures of induced tumors for expectation of scientific contribution of them to users, probably scientists from the world, who intend to reanalyze or compare with other data on radiation carcinogenesis. In this respect, this publication should be written in English as easily and simply as possible. It would be great pleasure for this little book to help something for or correspond to people who have interest in such experimental data and want to try to develop new experimental research by themselves in future.

Finally, we would like to express gratitude to many of our colleagues who had performed together a lot of experiments from the design to discussion; particularly, Dr. Yuji Yamada for his excellent and effortive aerosol technology, Dr. Nobuhito Ishigure for his accurate and logical dosimetry, Mr. Haruzo Iida for his careful support for animal experiments, Mr. Isao Takahashi for his helpful and devoted support for animal cares and preparations of histological specimens, and Mr. Akira Koizumi for his arrangements for radioprotection as well as encouragement to complete studies. As well, we would like to report with some pride the completion of this book to our previous supervisors, Drs. Osamu Matsuoka and Jiro Inaba who had organized and conducted us continuously to the fruitful goal of this great research project.

1. Introduction

The animal studies on the biological effects of internal exposures to transuranium elements have actually started in 1990 to elucidate particularly the risk for carcinogenesis as well as the risk mitigation for radioprotection following internal exposures to plutonium compounds. While many researchers and specific fields of sciences contributed to the inhalation studies on aerosol generation and assessment, biokinetics and behaviors, and macro- and microdosimetry, this archive covers pathological studies as well as raw data on not only specific but also non-specific tumors in small experimental animals following the intake of plutonium compounds.

In the first section, each of experimental studies was reviewed on the purpose, methods, design and sizes of experimental groups, brief summary of the results obtained, and the publication list of the related papers, respectively. These experimental studies include three sets of experiments on lifetime pulmonary carcinogenesis in the rat following inhalation exposures to $^{239}\text{PuO}_2$ aerosols, and two sets of comparative experiments using the same strain of rat following both whole-body or thoracic X-ray irradiation, and further three sets of experiments on lifetime carcinogenesis in the mouse following injections of soluble ^{239}Pu citrate solution, and two sets of comparative experiments on lymphomyleloid neoplasms using the same strains of mice following the injections of chemical carcinogen, MNU or the whole-body γ -ray irradiation, respectively.

In the second section, pathological findings, mainly histopathological diagnosis on tumors observed, were summarized in tables for each animal case from experimental groups as above described; total 23 experimental groups of rats for inhalation exposures to $^{239}\text{PuO}_2$ aerosols, total 15 groups of rats for X-ray irradiation, total 15 experimental groups of mice for injections of ^{239}Pu citrate, total 6 experimental groups of mice for MNU-injections, and total 6 experimental groups of mice for γ -ray irradiation, respectively. The data obtained from ^{239}Pu -exposed animals only referred to the tumors associated with neonatal death or incidental tumors, but not to non-neoplastic causes of death, and excluded the cases of animals which could not be examined due to cannibalism or severe autolysis.

In the third section, selected specimens of neoplasms among all the cases examined for histopathology were listed in tables as for paraffin-embedded blocks, section slides stained with hematoxylin and eosin and other immunohistochemical stainings, and digital microscopic photographs of lung tumors from $^{239}\text{PuO}_2$ -exposed or X-ray-irradiated rats, bone tumors from ^{239}Pu -injected mice, and lymphomyleloid neoplasms from ^{239}Pu -injected, MNU-injected or γ -ray-irradiated mice, respectively. These specimens were only selected from as fresh materials as possible without any postmortem changes, but excluded those of materials that were too old in formalin-fixed states or kept for a long time in the room temperature to examine under an optimal microscopic condition. Cell lines and DNA samples from lung and bone tumors were also listed.

Finally, official reports other than the scientific papers as well as research participants and collaborative researchers were listed in the last part of pages, in order to express our gratitude to all the people associated with this great research project with a confidence for any contribution of this booklet to the scientific basis of the risk evaluation, and a bit help for animal pathologists.

2. Review of Experimental Studies

2.1 Life-Span Studies on Pulmonary Carcinogenesis in the Rat

The following experimental studies have been performed for about 12 years from 1990 to 2002 to assess the lifetime risk for pulmonary carcinogenesis following inhalation exposures of adult female Wistar strain rats, which show much lower spontaneous lung tumor frequencies, to insoluble, submicron and polydisperse aerosols of high-fired $^{239}\text{PuO}_2$, and to compare effectiveness for pulmonary carcinogenesis and cellular and molecular events relevant to carcinogenic mechanisms, respectively, with those of either whole-body or thoracic irradiation with low linear-energy-transfer (LET) radiation, X-rays.

2.1.1 Inhalation Exposures of Rats to ^{239}Pu Dioxide Aerosols for Pulmonary Carcinogenesis

Purpose: The lifetime risk evaluation on pulmonary carcinogenesis specific to inhalation exposures to high-fired $^{239}\text{PuO}_2$ aerosols by establishment of the dose responsiveness for the incidences of malignant lung carcinomas at lower doses.

Animals: Female adult Wistar rats, 80-150 days of age at the inhalation exposures

Inhalation Exposures:

Single nose-only inhalation exposures of 20 animals at once to submicron and polydisperse aerosols (AMAD: 0.3-0.4 μm , GSD: 1.9-2.2) of high-fired $^{239}\text{PuO}_2$, generated through a nebulizer and heated to 1150 °C in a furnace.

Dosimetry: Initial lung deposition as determined for each exposed rat under anesthesia on Day 7 after exposures by a whole-body counting of LX-ray with a specific energy of 17 keV. Average cumulative lung doses as calculated during the lifetime from exposures (Day 0) up to death by the time-integral of initial lung deposition, retention function, and the lung weights.

Endpoints: Survival periods, causes of death, malignancies and histopathological types of primary lung tumors by histopathological examinations.

Experimental Groups:

Total 22 groups from A to C', each containing 20-60 exposed and 10-20 age-matched unexposed control animals as shown in the next page (**Table 1**). Total 660 of exposed animals and total 240 unexposed controls were kept under a barrier-filtered air condition to examine lifetime pulmonary carcinogenesis. About 30 exposed and 20 control animals were used only for lung dosimetry to establish retention function, and about 20 exposed and 10 control animals were excluded from pathological examinations because of severe autolysis and occasionally loss of main organs including the lung due to cannibalism at autopsy.

Table 1. Summary of Experimental Groups for Life-Span Studies on Pulmonary Carcinogenesis in the Rat Following Inhalation Exposures to $^{239}\text{PuO}_2$

C'	8/21/99	12/14/99	115	60	10	0.39(2.0)	34±13 (6-61)

Summary of Results:

Total 610 exposed and 206 control animals were available for pathological examinations and analyses on the dose effect relationships and risk for pulmonary carcinogenesis. The $^{239}\text{PuO}_2$ -exposed rats were divided into 9 groups, based on the mean initial lung deposition and lung dose, and the survival period after exposures and the number of primary lung tumors were compared between the control and each of exposed groups as shown below in **Table 2**. The main findings are summarized as follows;

- 1) Significant survival reduction was observed in the groups of exposed rats received the lung dose of 0.45 Gy or more, well correlated with the increase of malignant lung tumors.
- 2) Almost all the malignant lung tumors were carcinomas that drastically increased up to the maximum of about 90 % at 6.6 Gy.
- 3) Differential dose responsiveness was apparently observed among lung tumor types; adenomas at lower doses, adenocarcinomas at middle to higher doses, adenosquamous carcinomas at higher doses, and squamous cell carcinomas at higher doses, respectively.

Table 2. Survival Period and Lung Tumor Induction in the Rat Following Inhalation Exposures to $^{239}\text{PuO}_2$

Group Name	No. Animals	ILD (Bq)	Lung Dose (Gy)	Survival (day)	No. of Primary Lung Tumors	
					Benign	Malignant
Control	206	0	0	817±146	3	1

2.1.2 Inhalation Exposures of Rats to ^{239}Pu Dioxide Aerosols for Pathogenetic Processes

Purpose: The cellular and pathological events leading to pulmonary carcinogenesis during the period after inhalation exposures to high-fired $^{239}\text{PuO}_2$ aerosols, as well as estimation of the minimum dose and time required for the initiation of neoplastic lesions.

Animals: Female adult Wistar rats, 80-150 days of age at the inhalation exposures

Inhalation Exposures:

Single nose-only inhalation exposures of 20 animals at once to submicron and polydisperse aerosols (AMAD: 0.3-0.4 μm , GSD: 1.9-2.2) of high-fired $^{239}\text{PuO}_2$, generated through a nebulizer and heated to 1150 °C in a furnace.

Dosimetry: Initial lung deposition as determined for each exposed rat under anesthesia on Day 7 after exposures by a whole-body counting of LX-ray with a specific energy of 17 keV. Average cumulative lung doses as calculated during the lifetime from exposures (Day 0) up to death or sacrifice by the time-integral of initial lung deposition, retention function, and the lung weights.

Endpoints: The time-course changes in constituents of lung cells recovered by a bronchoalveolar lavage, the releasing activities of nitric oxide (NO) and tumor necrosis factor ($\text{TNF}\alpha$) from pulmonary alveolar macrophages (PAM), DNA synthesis of pulmonary epithelium, and microscopic pulmonary lesions including neoplasias by sequential sacrifice of animals on 1, 3, 6, 12, 18 and 24 months after inhalation exposures. Survival periods, causes of death, malignancies and histopathological types of primary lung tumors by histopathological examinations for dead animals during all the examination periods.

Experimental Groups:

Total 2 groups, Z and A', each containing 40-60 exposed and 10 age-matched unexposed control animals as shown in the next page (Table 3). All of these animals were kept under a barrier-filtered air condition, and at least 6 to 10 exposed and at least 3 control animals from each group were sacrificed only for sequential analyses on the cytokinetics, PAM-releasing activities, DNA synthesis and histopathological consequences on the period from 1 to 24 months after exposures. Total 10-15 animals from each group were died early from 155 days to late on 804 days after exposures to be autopsied for histopathological examinations, and only a few exposed animals were excluded from pathological examinations because of severe autolysis and occasionally loss of main organs including the lung due to cannibalism at autopsy.

Table 3 . Summary of Experimental Groups for Sequential Studies on Pulmonary Carcinogenesis in the Rat Following Inhalation Exposures to $^{239}\text{PuO}_2$

Group ID	Date of Birth	Date of Exposure	Age (day) at Exposure	No. of Exposed	No. of Unexposed	AMAD & (GSD)	Mean ILD \pm SD & (range)
Z	1/16/97	4/23/97	97	60	10	0.41(2.3)	188 \pm 55 (35-267) 366 \pm 60 (250-471) 453 \pm 68 (234-558)
A'	3/16/97	6/17/97	93	40	10	0.40(2.1)	374 \pm 66 (222-504)

Summary of Results:

The main findings on the sequential analyses are summarized as follows;

- 1) Cell yields of lavaged bronchoalveolar cells and PAMs were significantly reduced from 1 to 3 months after exposures, then recovered to the control (unexposed) levels.
- 2) The proportions of multinucleated or micronucleated PAMs significantly increased from 1 month, and sustained up to 18 months after exposures.
- 3) Both NO and TNF activities from the stimulated cultures of PAMs were significantly elevated 1-3 months after exposures, and NO activity was then reduced from 6 to 18 months, while TNF activity again increased from 12 to 18 months after exposures.
- 4) Labeling indices of bronchioloalveolar epithelial cells with BrdU significantly increased from 3 months and sustained up to 18 months after exposures.
- 5) After exudative inflammations during the period of 1 to 3 months after exposures, hyperplasia and metaplasia of the lining bronchioloalveolar epithelium were predominant from 3 to 6 months, while adenomatous and adenocarcinomatous lesions appeared to be developed from 12 months after exposures.
- 6) The appearance of primary lung tumors, mostly adenomas or adenocarcinomas, were found at the doses of 1-2 Gy from 12 months after exposures.

Publications:

1. Oghiso, Y., and Yamada, Y. Pathogenetic process of lung tumors induced by inhalation exposures of rats to plutonium dioxide aerosols. Radiat. Res. **154**: 253-260, 2000.

2.1.3 Inhalation Exposures of Rats to ^{239}Pu Dioxide Aerosols for Subcellular Events

Purpose: The mutation frequency and profile of *p53* tumor suppressor gene as the most plausible molecular event leading to pulmonary carcinogenesis in the rat following inhalation exposures to high-fired $^{239}\text{PuO}_2$ aerosols, and identification of cellular origins or target epithelial cells at risk for pulmonary carcinogenesis.

Animals: Female adult Wistar rats, 80-150 days of age at the inhalation exposures

Inhalation Exposures:

Single nose-only inhalation exposures of 20 animals at once to submicron and polydisperse aerosols (AMAD: 0.3-0.4 μm , GSD: 1.9-2.2) of high-fired $^{239}\text{PuO}_2$, generated through a nebulizer and heated to 1150 °C in a furnace.

Dosimetry: Initial lung deposition as determined for each exposed rat under anesthesia on Day 7 after exposures by a whole-body counting of LX-ray with a specific energy of 17 keV. Average cumulative lung doses as calculated during the lifetime from exposures (Day 0) up to death by the time-integral of initial lung deposition, retention function, and the lung weights.

Endpoints: Immunohistochemical detection of long-lived intranuclear p53 proteins, *Tp53* mutations analysed by PCR-SSCP and direct sequence on DNA extracted, and immunohistochemistry for surfactant apoprotein (SP-A) specific to type II pneumocytes or Clara cell antigen (CC-10) as plausible target pulmonary epithelial cells from selected histological paraffin sections of primary lung tumors of $^{239}\text{PuO}_2$ -exposed rats, respectively

Specimens from Experimental Groups:

Total 305 histological specimens of primary lung tumors were selected from 22 groups for immunohistochemistry of intranuclear p53 proteins, total 104 specimens from 19 groups for mutation analyses of *Tp53*, and total 146 specimens from 24 groups for immunohistochemistry of both surfactant protein specific to type II pneumocytes and Clara cell antigen as shown in Table 4, in addition to only one specimen from the control.

Table 4. Summary of Selected Specimens from Experimental Groups for Studies on Subcellular Events in the Rat Following Inhalation Exposures to $^{239}\text{PuO}_2$

Investigations on	Experimental Group & (No.)	Total No. Specimens	Lung Tumor Types			
			AD	AC	ASC	SCC
Immunohistochemistry of Intranuclear p53 Proteins	Group A - Y (20) Group B' - C' (2)	305	55	160	67	23
Mutation of <i>Tp53</i>	Group A - Y (19)	104	10	35	41	18
Immunohistochemistry of Surfactant Apoproteins	Group A - A' (22) Group B' - C' (2)	146	25	65	37	19

Summary of Results:

The main findings on each of investigations are summarized as follows;

- 1) The positivity for CM1 antibody to rat p53 proteins was very low in the histological sections of primary lung tumors as shown by the following results; only 9 cases (2.9%) were strongly positive, 48 cases (15.7%) slightly positive, and 248 cases (81.3%) negative among total 305 cases examined. The relevance of the positivity to the histopathological types of tumors was not noted.
- 2) Intact DNA were extracted from 98 cases among total 104 cases examined, and the abnormalities were found in 31 cases (31.6%) by PCR-SSCP analysis of 99 cases, and only 13 cases (13.3%) showed G to A or C to T transitional point mutations by direct sequence of 31 cases. The relevance of the mutation frequency to the histopathological types of lung tumors was not, however, observed.
- 3) Most of adenomas (AD:75%) and adenocarcinomas (AC:82%) were positive for type II pneumocytes-specific SP-A, while 79% of adenomas as well as 47% of adenocarcinomas were positive for Clara cell antigen, CC-10, suggesting that these types of tumors originate from either type II or Clara cells. Adenosquamous (ASC) and squamous cell (SCC) carcinomas were, however, almost negative for both antigens.

2.1.4 X-ray Irradiation of Rats for Pulmonary Carcinogenesis

Purpose: The dose responsiveness and morphologic characteristics of rat lung tumors induced by whole-body or thoracic X-ray irradiation as compared with those following inhalation exposures to high-fired $^{239}\text{PuO}_2$ aerosols.

Animals: Female adult Wistar rats, mostly 100-150 days of age at irradiation

Irradiation Regimens:

The X-ray was generated by using Pantak HF 320S (Shimadzu). For whole-body X-irradiation, 5 animals in a cylindrical Lucite holder were exposed repeatedly to fractionated X-rays by a split dose of 0.5 Gy at a dose rate of 0.1 Gy/min under the condition of 200 kVp and 6.0 mA with 0.5 mm Cu and 0.5 mm Al filters and with FSD of 100 cm by 2- to 3-day intervals to achieve total accumulated dose of 0.5 to 10 Gy. For local, thoracic X-irradiation, 5 anesthetized animals in a rectangular Lucite holder, shielded with a 5 mm-thick lead sheet except for the thorax, were exposed once to a single dose of X-rays at a dose rate of 0.6 Gy/min under the condition of 200 kVp and 20 mA with 0.5 mm Cu and 0.5 mm Al filters and with FSD of 75 cm to achieve total accumulated dose of 1.0 to 10 Gy.

Dosimetry: Dose measurement was carried out during all irradiation procedures with a 0.6 ml C-110 ionization chamber in a conjunction with a thermoluminescent dosimeter (model AE-1321M, Applied Engineering Inc.) put onto the central or thoracic position of an empty chamber of the Lucite holder used for the above irradiation regimens. The average total accumulated doses measured were regarded as absorbed doses in the whole lung of each experiment.

Endpoints: Survival periods, causes of death, malignancies and histopathological types of primary lung tumors by histopathological examinations.

Experimental Groups:

Total 6 groups from X-1 to X-6, each containing 50-80 whole-body X-irradiated and 10-65 age-matched unirradiated control animals, and total 8 groups from X-8 to X-15, each containing 30-60 thoracic X-irradiated and 10-30 unirradiated control animals, respectively as shown in the next page (**Table 5**). Total 650 of X-irradiated animals and total 205 unirradiated controls were kept for their lifetimes to examine lifetime pulmonary carcinogenesis. About 50 animals from these groups were, however, excluded from pathological examinations because of severe autolysis and occasionally loss of main organs including the lung due to cannibalism at autopsy.

Table 5. Summary of Experimental Groups for Life-Span Studies on Pulmonary Carcinogenesis in the Rat Following X-Irradiation (Whole-Body X-Irradiation)

Group Name	Birth Date	Period of Irradiation Date	Age (day) at Final Irradiation	No. of Irradiated	No. of Unirradiated	Total Dose (Gy)
X-1	3/28/96	6/24/96-7/26/96	120	50	20	0.5-5.0
X-2	7/20/96	-	-	0	65	0
X-3	10/24/96	1/20/97-2/21/97	120	60	0	0.5-5.0
X-4	2/16/97	5/19/97-6/20/97	124	80	0	0.5-5.0
X-5	4/17/97	7/11/97-8/11/97	116	60	20	0.5-5.0
X-6	6/22/97	9/16/97-11/28/97	159	50	10	10.0

(Thoracic X-Irradiation)

Group Name	Birth Date	Irradiation Date	Age (day) at Irradiation	No. of Irradiated	No. of Unirradiated	Total Dose (Gy)
X-8	2/20/99	8/25/99	186	40	10	3.0-5.0
X-9	3/27/99	8/26/99	152	40	10	3.0-5.0
X-10	9/23/99	1/7/00	106	45	10	3.0-10.0
X-11	10/26/99	2/3/00	100	45	10	3.0-10.0
X-12	11/22/99	3/9/00	108	45	10	3.0-10.0
X-13	1/25/00	5/2/00	98	45	10	3.0-10.0
X-14	3/21/00	6/30/00	101	30	30	1.0
X-15	5/29/00	9/8/00	102	60	0	1.0

Summary of Results:

Almost total 600 exposed and 150 control animals were available for pathological examinations and analyses on the dose effect relationships and risk for pulmonary carcinogenesis. The survival period after the cessation of irradiation and the incidence of primary lung tumors from the controls and each of the groups (A to F for whole-body X-irradiation and G to J for thoracic X-irradiation) of rats were summarized as shown in the next page (**Table 6**). The main findings are summarized as follows;

- 1) Significant survival reduction was observed in the groups of rats received the dose of 2.0 Gy or more for whole-body X-irradiations and 5.0 Gy or more for thoracic X-irradiation, respectively, but mostly due to the increase of malignant and metastatic solid tumors other than lung tumors.
- 2) Most of primary lung tumors were adenomas and adenocarcinomas, both of which significantly increased only at the dose of 5.0 Gy or more in thoracic X-irradiated animals.
- 3) The proportions of each histopathological type of lung tumor lesions distributed in the lungs were almost 50 % adenomas, 30-40% adenocarcinomas, and 10-20% adenosquamous and squamous cell carcinomas.

**Table 6. Survival Period and Lung Tumor Induction in the Rat Following X-Irradiation
(Whole-Body X-Irradiation)**

Group Name	No. Animals	Dose (Gy)	Survival (day)	No. of Primary Lung Tumors

2.1.5 X-ray Irradiation of Rats for Subcellular Events

Purpose: The mutation frequency and profile of *p53* tumor suppressor gene as the most plausible molecular event leading to pulmonary carcinogenesis in the rat following X-ray irradiation, and identification of cellular origins or target epithelial cells at risk for pulmonary carcinogenesis to compare with those following inhalation exposures to high-fired $^{239}\text{PuO}_2$ aerosols.

Animals: Female adult Wistar rats, mostly 100-150 days of age at irradiation

Irradiation Regimens:

The X-ray was generated by using Pantak HF 320S (Shimadzu). For whole-body X-irradiation, 5 animals in a cylindrical Lucite holder were exposed repeatedly to fractionated X-rays by a split dose of 0.5 Gy at a dose rate of 0.1 Gy/min under the condition of 200 kVp and 6.0 mA with 0.5 mm Cu and 0.5 mm Al filters and with FSD of 100 cm by 2- to 3-day intervals to achieve total accumulated dose of 0.5 to 10 Gy. For local, thoracic X-irradiation, 5 anesthetized animals in a rectangular Lucite holder, shielded with a 5 mm-thick lead sheet except for the thorax, were exposed once to a single dose of X-rays at a dose rate of 0.6 Gy/min under the condition of 200 kVp and 20 mA with 0.5 mm Cu and 0.5 mm Al filters and with FSD of 75 cm to achieve total accumulated dose of 1.0 to 10 Gy.

Dosimetry: Dose measurement was carried out during all irradiation procedures with a 0.6 ml C-110 ionization chamber in a conjunction with a thermoluminescent dosimeter (model AE-1321M, Applied Engineering Inc.) put onto the central or thoracic position of an empty chamber of the Lucite holder used for the above irradiation regimens. The average total accumulated doses measured were regarded as absorbed doses in the whole lung of each experiment.

Endpoints: Immunohistochemical detection of long-lived intranuclear p53 proteins, *Tp53* mutations analysed by PCR-SSCP and direct sequence on DNA extracted, and immunohistochemistry for surfactant apoprotein (SP-A) specific to type II pneumocytes or Clara cell antigen (CC-10) as plausible target pulmonary epithelial cells from selected histological paraffin sections of primary lung tumors of X-irradiated rats, respectively

Specimens from Experimental Groups:

Total 66 histological specimens of primary lung tumors for immunohistochemistry of intranuclear p53 proteins, total 33 specimens for mutation analyses of *Tp53*, and total 64 specimens for immunohistochemistry of both surfactant protein specific to type II pneumocytes and Clara cell antigen were selected from 13 groups, respectively as shown in the next page (**Table 7**).

Table 7. Summary of Selected Specimens from Experimental Groups for Studies on Subcellular Events in the Rat Following X-Irradiation

Investigation Assays for	Experimental Groups & (No.)	Total No. Specimens	Lung Tumor Types			
			AD	AC	ASC	SCC
Immunohistochemistry of Intranuclear p53 Proteins	Group X-1 to X-6 (6) Group X-8 to X-14 (7)	66	29	28	2	7
Mutation of <i>Tp53</i>	Group X-1 to X-6 (6) Group X-8 to X-14 (7)	33	11	17	1	4
Immunohistochemistry of Surfactant Apoproteins	Group X-1 to X-6 (6) Group X-8 to X-14 (7)	64	27	28	2	7

Summary of Results:

The main findings on each of investigations are summarized as follows;

- 1) The positivity for CM1 antibody to rat p53 proteins was very low in the histological sections of primary lung tumors as shown by the following results; none the positive cases, only 3 cases (4.5%) slightly positive, and most 63 cases (95.5%) negative among total 66 cases examined. The relevance to the histopathological types of tumors was not noted, and no differences between whole-body and thoracic X-irradiation.
- 2) Intact DNA were extracted from 29 cases among total 33 cases examined, and the abnormalities were found in 9 cases (31.0%) by PCR-SSCP analysis of 29 cases, but only one case (3.4%) showed C to T transitional point mutations by direct sequence of 9 cases.
- 3) Most of adenomas (AD:80%) and adenocarcinomas (AC:74%) were positive for Clara cell antigen, CC-10, while 53% of adenomas and 74% of adenocarcinomas were positive for type II pneumocytes-specific SP-A, suggesting that these types of tumors originate from either type II or Clara cells. Adenosquamous (ASC) and squamous cell (SCC) carcinomas were, however, negative for both antigens.

2.2 Life-Span Studies on Carcinogenesis in the Mouse

The following experimental studies have been performed for about 11 years from 1991 to 2002 to assess the lifetime risk, spectrum and pathogenetic processes for carcinogenesis following injections of soluble ^{239}Pu citrate solutions into three strains of adult female mice, which show different spontaneous and external radiation-induced tumor spectra, and to compare carcinogenicity and subcellular mechanisms specific to plutonium compounds with those of either chemical carcinogen-administered or γ -ray irradiated mice, respectively.

2.2.1 Injections of ^{239}Pu Citrate Solution into C3H Mice for Carcinogenesis

Purpose: The lifetime risk evaluation on bone and the other tumors specific to injected, soluble ^{239}Pu citrate solution into C3H mice which are recognized to show higher frequency of spontaneous hepatocellular carcinomas, but much less frequencies or none of lymphomyeloid neoplasms and bone tumors.

Animals: Female adult C3H strain mice, 90-110 days of age at the time of injections.

Injections: Single intraperitoneal injections of monomeric ^{239}Pu citrate solution (pH 6.8 to 7.2) diluted with physiological saline into different amounts of activities; 10, 100, 500, 1000, 5000 and 10000 Bq/animal, respectively.

Dosimetry: The separate group of mice received 1000 Bq/animal of ^{239}Pu citrate was sequentially sacrificed to measure the concentration of the retained activity in the ashed bones in a liquid scintillation spectrometer, resulting in the negatively exponential skeletal retention function. The cumulative mean skeletal dose for each animal until death was calculated by the time integral of the injected dose (Bq) and skeletal retention function.

Endpoints: Survival periods, causes of death, spectrum and distribution of tumors observed, particularly bone tumors and lymphoid neoplasms by histopathological examinations.

Experimental Groups:

Total 5 groups from IP1 to IP5, each containing 50-55 injected and 20 age-matched, saline-injected (carrier) control animals as shown in **Table 8**. Another separate group of 30 animals received 1000 Bq/animal was used for sequential analysis of skeletal retention as described above.

Table 8. Summary of Experimental Groups for Life-Span Studies on Carcinogenesis in C3H Mice Following Injections of ^{239}Pu Citrate Solution

Group Name	Mouse Strain	Birth Date	Injection Date	Age (day) at Injection	No. of Pu-Injected	No. of Controls	Injected Dose (Bq)
IP1	C3H	5/1/91	8/7/91	98	50	20	500-10000
IP2	C3H	7/2/91	10/17/91	107	55	20	500-10000
IP3	C3H	9/13/91	12/12/91	90	55	20	500-10000
IP4	C3H	2/11/93	5/28/93	106	50	20	10-100
IP5	C3H	5/2/93	7/30/93	89	50	20	10-100

Summary of Results:

Total 260 injected and 100 control animals were available for postmortem pathological examinations and analyses on the survivals, neoplastic or non-neoplastic death, and the dose effect relationships for bone or lymphoid tumors observed. The ^{239}Pu -injected mice were divided into 8 groups, based on the injected dose and skeletal dose, and the mean survival time and number of tumors in each group were shown as below in **Table 9**. The main findings are summarized as follows;

- 1) Significant survival reduction was observed at the mean skeletal dose of 2.93 Gy or more, resulted from an earlier increase of neoplastic or non-neoplastic death.
- 2) Almost all the bone tumors were osteosarcomas, and were not found in the controls but increased drastically to a maximum incidence of 96% at 6.92 Gy, while non-thymic but pre-B cell type lymphomas were not found in the controls and at the doses of less than 6.92 Gy but increased up to a maximum incidence of 36% at the higher doses more than 10 Gy.
- 3) The other solid tumors rather decreased at the doses of 2.93 Gy or more, and no myeloid leukemias were found in the controls and all the groups of ^{239}Pu -injected animals.

Table 9. Survival Period and Tumor Induction in C3H Mice Following Injections of ^{239}Pu Citrate

Group Name	No. Animals	Injected Dose (Bq)	Skeletal Dose (Gy)	Survival (day)	No. of Tumor-Bearers

2.2.2 Injections of ^{239}Pu Citrate Solution into Different Strains of Mice for Carcinogenesis

Purpose: The lifetime risk evaluation on bone and the other tumors specific to injected, soluble ^{239}Pu citrate solution into different strains of mice that are recognized to show different spectra of spontaneous or radiation-induced tumors.

Animals: Female adult C3H/HeN, C57BL/6J, and B6C3F1 strains of mice, 70-140 days of age at the time of injections.

Injections: Single intraperitoneal injections of monomeric ^{239}Pu citrate solution (pH 6.8 to 7.2) diluted with physiological saline into different amounts of activities; 100, 500, 1000, 5000 and 10000 Bq/animal, respectively.

Dosimetry: The separate group of mice received 1000 Bq/animal of ^{239}Pu citrate was sequentially sacrificed to measure the concentration of the retained activity in the ashed bones in a liquid scintillation spectrometer, resulting in the negatively exponential skeletal retention function. The cumulative mean skeletal dose for each animal until death was calculated by the time integral of the injected dose (Bq) and skeletal retention function.

Endpoints: Survival periods, causes of death, spectrum and distribution of tumors observed, particularly bone tumors and lymphoid neoplasms by histopathological examinations.

Experimental Groups:

Total 18 groups from IP7 to IP14, each containing 10-33 injected and 10-20 age-matched, saline-injected (carrier) control animals as shown in **Table 10**.

IP14	BC3	8/15/00	12/15/00	122	32	10	10000

Summary of Results:

Total 467 injected and 180 control animals from three strains were available for postmortem pathological examinations and analyses on the survivals, neoplastic or non-neoplastic death, and the dose effect relationships for bone or lymphoid tumors observed. The ^{239}Pu -injected mice from each strain were divided respectively into 5 groups, based on the injected dose and skeletal dose, and the mean survival time and number of tumors in each group were shown in the next page (**Table 11**). The main findings are summarized as follows;

- 1) Significant survival reduction was observed in all the strains of mice received 500 Bq or more, resulted mostly from an early increase of bone tumors.
- 2) Most of the bone tumors from all the strains of mice were osteosarcomas, and increased in a dose-dependent manner to a maximum incidence of 50-63% at the mean skeletal dose of 2-3 Gy.
- 3) Lymphoid neoplasms observed in all the strains of mice received 5000 Bq or more appeared early and were characterized by pre-B-cell lymphomas derived from progenitor B-cells.
- 4) The other solid tumors rather decreased in all the strains of mice received 500 Bq or more, and none or fewer myeloid leukemias were found in the controls and all the groups of ^{239}Pu -injected animals.
- 5) As the trials of molecular approach for osteosarcomagenesis, PCR-SSCP analysis was performed on mutations of *Tp53* tumor suppressor gene, or *K-ras*, *H-ras* and *N-ras* oncogenes. Even though total 11 cases of osteosarcomas, available for DNA extraction from fresh and frozen samples, were examined, only one case showed C to A transversion point mutation on the exon 7 of *Tp53*.
- 6) Non-neoplastic lesions from the control and ^{239}Pu -injected mice were mostly distributed in the liver and kidneys, and rarely in the spleen, lung and heart, including fatty degeneration and necrosis of hepatocytes, glomerulonephritis or interstitial nephritis, splenic Gandy-Gamma-like body, idiopathic pulmonary alveolar proteinosis (IPAP)-like alveolar surfactant accumulation, and myocardial or periarteriolar fibrosis, while any specific dose responsiveness for these lesions was not seen, as well as strain differences in the appearance.

2.2.3 Injections of ^{239}Pu Citrate Solution into Mice for Hemopoietic Changes

Purpose: Time-course hemopoietic changes related directly or indirectly to lymphomyleoid neoplasms following injections of soluble ^{239}Pu citrate solution into different strains of mice that are recognized to show different spectra of spontaneous or radiation-induced lymphomyleoid neoplasms.

Animals: Female adult C3H/HeN, C57BL/6J, and B6C3F1 strains of mice, 90-110 days of age at the time of injections.

Injections: Single intraperitoneal injections of monomeric ^{239}Pu citrate solution (pH 6.8 to 7.2) diluted with physiological saline into 5000 Bq/animal, an optimal dose for acute or subacute hemopoietic derangements and for induction of lymphoid neoplasms.

Dosimetry: The separate group of mice received 1000 Bq/animal of ^{239}Pu citrate was sequentially sacrificed to measure the concentration of the retained activity in the ashed bones in a liquid scintillation spectrometer, resulting in the negatively exponential skeletal retention function. The cumulative mean skeletal dose for each animal until death was calculated by the time integral of the injected dose (Bq) and skeletal retention function.

Endpoints: Numbers of peripheral white blood cells, bone marrow and spleen cells, numbers of granulocyte-macrophage colony-forming cells (GM-CFC) in the bone marrow and the spleen during the period of one year after injections. As well, survival periods, causes of death, spectrum and distribution of tumors, particularly bone tumors and lymphoid neoplasms observed in dead or sacrificed animals.

Experimental Groups:

Total 6 groups from IP10 to IP11, each containing 10-20 injected and 10-15 age-matched, saline-injected (carrier) control animals as shown in Table 12.

Table 12. Summary of Experimental Groups for Sequential Studies on Hemopoietic Changes in 3 Strains of Mice Following Injections of ^{239}Pu citrate

Group ID	Mouse Strain	Birth Date	Injection Date	Age (day) at Injection	No. of Pu-Injected	No. of Controls	Injected Dose (Bq)
IP10-1	C3H	9/11/97	12/19/97	98	20	15	5000
IP10-2	C3H	9/11/97	12/19/97	98	20	15	5000
IP10-3	C3H	9/11/97	12/19/97	98	20	15	5000
IP11-1	C3H	3/24/98	6/25/98	93	10	10	5000
IP11-2	C57	3/10/98	6/25/98	107	10	10	5000
IP11-3	BC3	3/24/98	6/25/98	93	10	10	5000

Summary of Results:

Four injected and two control animals from each strain were respectively sacrificed and examined for hematological changes at 30, 90, 180, 240, and 365 days after injections. The main findings are summarized as follows;

- 1) Peripheral white blood cells as well as bone marrow cells were persistently reduced in all the strains of mice from 90 days on, while spleen cells increased from 180 days on due to a compensatory extramedullary hemopoiesis.
- 2) Granulocyte-macrophage colony-forming cells (GM-CFC) were consistently reduced in the bone marrow but increased in the spleen from 90 days on.

2.2.4 Injections of MNU into Mice for Lymphoid Neoplasms

Purpose: The carcinogenicity of an alkylating agent, N-methyl-N-nitrosourea (MNU) to induce lymphoid neoplasms in 3 different strains of mice, as compared to those following injections of ^{239}Pu citrate.

Animals: Female adult C3H/HeN, C57BL/6J, and B6C3F1 strains of mice, 90-100 days of age at the time of injections.

Injections: Five weekly intraperitoneal injections of 40 mg/kg body weight of MNU to achieve total 5-6 mg/animal, an optimal dose for induction of thymic lymphomas as described.

Endpoints: The frequency of lymphoid neoplasms and their histological and immunohistochemical phenotypes induced.

Experimental Groups:

Total 6 groups from MNU-1 to MNU-6, each containing 30 injected and 10 age-matched, saline-injected (carrier) control animals as shown in **Table 13**.

Table 13. Summary of Experimental groups for Studies on Lymphoid Neoplasms in 3 Strains of Mice Following Injections of MNU

Group ID	Mouse Strain	Birth Date	Period of Injection Date	Age (day) at Final Injection	No. of Injected	No. of Controls
MNU-1	C3H	7/18/00	9/18/00-10/17/00	91	30	10
MNU-2	C57	10/3/00	12/4/00-12/31/00	89	30	10
MNU-3	BC3	11/14/00	1/15/01-2/12/01	90	30	10
MNU-4	C3H	4/26/01	7/2/01-7/30/01	95	30	10
MNU-5	C57	5/28/01	8/6/01-9/3/01	98	30	10
MNU-6	BC3	9/17/01	11/26/01-12/25/01	99	30	10

Summary of Results:

The survival periods and lymphoid neoplasms induced in 3 strains of mice after injections of MNU were summarized in the next page (**Table 14**). The main findings are summarized as follows;

- 1) Lymphoid neoplasms, mostly T-lymphoblastic lymphomas, appeared very early after injections of MNU in all the strains of mice.
- 2) Interestingly, stomach squamous cell carcinomas were observed in a small yield (18%) of C3H mice.

Table 14 Survival Period and Lymphoid Neoplasms Induced in 3 Strains of Mice Following Injections of MNU

Mouse Strains	No. Animals	Survival (day)	No. of Lymphoid Neoplasms				No. Other Tumors
			All	T-cell	B-cell	Histiocytic	
C3H	60	106±64	20	18	2	0	11
C57	60	58±14	29	25	4	0	0
BC3	60	81±23	47	43	4	0	2

2.2.5 γ -ray Irradiation of Mice for Carcinogenesis

Purpose: The lifetime risk and spectra of tumors, particularly lymphomyeloid neoplasms, specific to external low LET γ -ray irradiation in different strains of mice, as compared to those following injections of ^{239}Pu citrate or MNU.

Animals: Female adult C3H/HeN, C57BL/6J, and B6C3F1 strains of mice, 85-88 days of age at the time of irradiation.

Irradiations: Single whole-body γ -ray irradiation with a dose rate of 0.6 Gy/min using a sealed ^{137}Cs -source to achieve total absorbed doses of 1.0 to 3.0 Gy.

Dosimetry: Dose measurement was carried out during all irradiation procedures with an ionization chamber in a conjunction with a thermoluminescent dosimeter. The average total accumulated doses measured were regarded as absorbed doses.

Endpoints: Survival periods, causes of death, spectrum and distribution of tumors observed, particularly lymphomyeloid neoplasms by histopathological examinations.

Experimental Groups:

Total 6 groups from γ -1 to γ -6, each containing 90 irradiated and 12 age-matched, unirradiated control animals as shown in **Table 15**.

Table 15. Summary of Experimental Groups for Life-Span Studies on Carcinogenesis in 3 Strains of Mice Following γ -Irradiation

Group Name	Mouse Strain	Birth Date	Irradiation Date	Age (day) at Irradiation	No. of Irradiated	No. of Controls	Total Dose (Gy)
γ -1	C3H	9/27/01	12/21/01	85	90	12	1.0-3.0
γ -2	C57	9/10/01	12/7/01	88	90	12	1.0-3.0
γ -3	BC3	10/15/01	1/11/02	88	90	12	1.0-3.0
γ -4	C3H	10/18/01	1/11/02	85	90	12	1.0-3.0
γ -5	C57	11/12/01	2/8/02	88	90	12	1.0-3.0
γ -6	BC3	12/18/01	3/15/02	87	90	12	1.0-3.0

Summary of Results:

Total 180 irradiated (60 each with total dose of 1.0, 2.0 and 3.0 Gy) and 24 control animals from each strain were kept under a barrier filtered air condition for postmortem pathological examinations on the survivals and tumors observed. The results on the survival periods and tumors of all the strains of mice are summarized in the next page (**Table 16**). In addition, non-neoplastic lesions from the control and γ -irradiated mice were examined, and the temporarily distributed mostly in the liver and kidneys, and rarely in the pancreas, spleen, heart or lung. Any specific relations of these non-neoplastic lesions to doses or strain differences in the appearance were not found.

3. Summary of Pathological Findings on Individual Animals from Each Experimental Group

3.1 Pulmonary Carcinogenesis in Rats

The experimental groups for lifetime risk evaluation on pulmonary carcinogenesis in female Wistar rats following either inhalation exposures to $^{239}\text{PuO}_2$ aerosols or both of whole-body and thoracic X-irradiation are the objects for summarization of pathological findings, mainly histopathology of primary lung tumors as well as the other incidental tumors including metastasis, on individual animals which were only available for postmortem pathological examinations without cannibalism and autolysis of lungs. Information on the experimental regimens is also attached to each table list on pathological findings.

3.1.1 Experimental Groups for Inhalation Exposures to ^{239}Pu Dioxide Aerosols Groups of Control Animals

The control groups of unexposed animals as listed below correspond to each of experimental groups of exposed animals (Groups C to Y), respectively.

3.1.2 Experimental Groups for X-ray Irradiation

Groups of Control Animals for Whole-Body X-Irradiation

The control groups of unirradiated animals for whole-body X-irradiation (WBX) as listed below correspond to each of experimental groups of irradiated animals (Groups X-1 to X-6), respectively.

Control Groups for WBX

Animal ID	Dose (Gy)	Survival (day)	Post-X (day)	Histopathology	
				Lung Tumors	Other Tumors
X-1-Ct1-1	0	716	596		
X-1-Ct1-2	0	723	603		Ov.adenocarcinoma

Groups of Whole-Body X-Irradiated Animals

The experimental groups of whole-body X-irradiated animals as listed below include the Groups X-1 to X-6, and the information on the experimental regimens including the age of animals at the cessation of irradiation and the total doses, is attached to the head of the table for each group, respectively.

Group X - 1

[Age at the cessation of irradiation: 120 days/Total dose: 0.5 to 5.0 Gy]

Animal ID	Dose (Gy)	Survival (day)	Post-X (day)	Histopathology	
				Lung Tumors	Other Tumors
X-1-1-1	0.5	704	616		
X-1-1-2	0.5	729	641		Mam.tumor

3.2.Carcinogenesis in Mice

The experimental groups for lifetime risk evaluation on bone tumors, lymphomyeloid neoplasms and the other solid tumors specific or non-specific to injected, soluble ^{239}Pu citrate solution into different strains of mice are the objects for summarization of pathological findings, mainly histopathology of fatal and incidental tumors, on individual animals which were only available for postmortem pathological examinations without cannibalism and autolysis of main organs. In addition, the experimental groups of the same strains of mice following either injections of MNU or whole-body γ -ray irradiation for comparisons with ^{239}Pu -induced carcinogenesis, particularly in special reference to lymphomyeloid neoplasms. Information on the experimental regimens is also attached to each table list on pathological findings.

3.2.1 Experimental Groups for Injections of ^{239}Pu Citrate Solution

Groups of Control Animals

The control groups of saline-injected animals as listed below correspond to each of experimental groups of ^{239}Pu -injected animals, Groups IP1 to IP5 of C3H mice, and Groups IP7 to IP14 of three strains of mice, respectively.

Control Groups for Groups IP1-5 (C3H Mice)

Animal ID	Survival (day)	Histopathology	
		Fatal Tumors	Incidental Tumors
O-240-1	727	Thymic lymphoma	Ov.cystadenoma

Non-Neoplastic Lesions from the Groups of ^{239}Pu -Injected and Control Animals

The non-neoplastic lesions from the experimental groups of ^{239}Pu -injected and control animals (Groups IP1 to IP5 of C3H mice and IP7 to IP14 of three strains of mice) are summarized only for individual cases that were described in the histopathological findings. The tables as below contain the information on the injected dose, survival period, and histopathological diagnosis of non-neoplastic lesions and neoplasms in each case.

Groups IP1-5, IP7-11 & IP12 (C3H)

Animal ID	IP Dose (Bq)	Survival (day)	Histopathology	
			Non-Neoplastic Lesions	Neoplasms

3.2.2 Experimental Groups for Injections of MNU

Groups of MNU-Injected Animals

The experimental groups of MNU-injected animals as listed below include the Groups MNU-1 to MNU-6 of three strains of mice, and the information on the experimental regimens including the age of animals at injections and total injected doses is attached to the head of the table for each group, respectively.

Group MNU-1 (C3H)

[Age at the cessation of injections: 91 days/Injected doses: 5-6 mg/animal]

Animal ID	Survival/Post-IP (day)	Histopathology	
		Lymphoid Neoplasms	Other Tumors
MNU-1-1-1	141/50		
MNU-1-3-1	156/65		
MNU-1-3-3	160/69		
MNU-1-3-4	166/75	Thymic lymphoma	
MNU-1-3-5	171/80	Thymic lymphoma	
MNU-1-3-6	176/85	Thymic lymphoma	
MNU-1-2-1	178/87	Thymic lymphoma	
MNU-1-3-7	178/87	Thymic lymphoma	
MNU-1-2-2	181/90		Stomach squamous cell carcinoma
MNU-1-3-8	186/95	Thymic lymphoma	
MNU-1-2-3	196/106	Thymic lymphoma	
MNU-1-1-2	200/110	Thymic lymphoma	
MNU-1-3-9	205/115	Thymic lymphoma	
MNU-1-1-3	205/115	Lymphoid leukemia	
MNU-1-3-10	209/119	Thymic lymphoma	Stomach squamous cell carcinoma
MNU-1-3-11	210/120	Thymic lymphoma	
MNU-1-1-4	219/129		
MNU-1-2-4	227/137	Thymic lymphoma	
MNU-1-1-5	233/142	Thymic lymphoma	Stomach squamous cell carcinoma
MNU-1-1-6	256/165		
MNU-1-2-5	266/175		
MNU-1-2-6	284/193		Ur.BI.fibrosarcoma
MNU-1-1-7	295/204		
MNU-1-2-7	317/226		Stomach squamous cell carcinoma
MNU-1-1-8	333/242		Stomach squamous cell carcinoma
MNU-1-2-8	351/260		Uterus carcinoma
MNU-1-1-9	355/264		Ov. granulosa cell tumor
MNU-1-2-9	374/283		Ov. adenocarcinoma
MNU-1-1-10	390/299		Stomach SCC/Lung adenoma

Group MNU-2 (C57)

[Age at the cessation of injections: 89 days/Injected doses: 5-6 mg/animal]

Animal ID	Survival/Post-IP (day)	Histopathology	
		Lymphoid Neoplasms	Other Tumors
MNU-2-2-1	132/43	Thymic lymphoma	
MNU-2-3-1	134/45	Thymic lymphoma	
MNU-2-1-1	141/52		
MNU-2-1-2	141/52		
MNU-2-1-3	141/52		
MNU-2-3-2	143/54	Thymic lymphoma	
MNU-2-1-4	143/54	Thymic lymphoma	
MNU-2-3-3	144/55	Thymic lymphoma	
MNU-2-1-5	146/57		
MNU-2-3-4	146/57		
MNU-2-2-2	152/63		
MNU-2-3-5	153/64	Thymic lymphoma	
MNU-2-1-6	154/65		
MNU-2-2-3	155/66		
MNU-2-3-6	159/70		
MNU-2-3-7	159/70	Thymic lymphoma	
MNU-2-2-4	165/76		
MNU-2-3-8	166/77	Thymic lymphoma	
MNU-2-2-5	167/78		
MNU-2-3-9	170/81	Thymic lymphoma	
MNU-2-1-7	170/81	Lymphoma	
MNU-2-3-10	173/84		
MNU-2-3-11	173/84		

Group MNU-3 (BC3)

[Age at the cessation of injections: 90 days/Injected doses: 5-6 mg/animal]

Animal ID	Survival/Post-IP (day)	Histopathology	
		Lymphoid Neoplasms	Other Tumors
MNU-3-1-1	121/31	Thymic lymphoma	
MNU-3-1-2	127/37		
MNU-3-3-1	129/39	Thymic lymphoma	
MNU-3-3-2	138/48	Thymic lymphoma	
MNU-3-1-3	141/51	Thymic lymphoma	
MNU-3-2-1	143/53		
MNU-3-1-4	145/55	Thymic lymphoma

3.2.3 Experimental Groups for γ -ray Irradiation

Groups of Control Animals

The control groups of unirradiated animals for whole-body γ -irradiation as listed below correspond to each of experimental groups of γ -irradiated animals (Groups γ -1 to γ -6), respectively.

Control Groups for γ -1 & γ -4 (C3H)

Animal ID	Survival (day)	Histopathology	
		Fatal Tumors	Other Tumors
γ -1-Ct-2-1	636/(551)	Lymphoma(T-LBL)	
γ -1-Ct-1-1	774/(689)		
γ -1-Ct-2-2	809/(724)		
γ -1-Ct-1-2	825/(740)		
γ -1-Ct-1-3	855/(770)		
γ -1-Ct-1-4	855/(770)		
γ -1-Ct-1-5	858/(773)		
γ -1-Ct-1-6	858/(773)		
γ -1-Ct-2-3	859/(774)		
γ -1-Ct-2-4	904/(819)		
γ -1-Ct-2-5	907/(822)		
γ -1-Ct-2-6	928/(843)		
γ -4-Ct-1-1	763/(678)		
γ -4-Ct-2-1	820/(735)		
γ -4-Ct-2-2	890/(805)		
γ -4-Ct-1-2	902/(817)		
γ -4-Ct-1-3	908/(823)		Mam.adenocarcinoma
γ -4-Ct-2-3	915/(830)		
γ -4-Ct-2-4	915/(830)		SC tumor
γ -4-Ct-2-5	921/(836)	Liver tumor	
γ -4-Ct-1-4	949/(864)		
γ -4-Ct-1-5	951/(866)	Lymphoma	
γ -4-Ct-1-6	951/(866)		
γ -4-Ct-2-6	951/(866)	SC Carcinoma	

Control Groups for γ -2 & γ -5 (C57)

Animal ID	Survival (day)	Histopathology	
		Fatal Tumors	Other Tumors
γ -2-Ct-2-1	546/(458)	Myeloid leukemia	
γ -2-Ct-2-2	689/(601)	Lymphoma	
γ -2-Ct-1-1	764/(676)		
γ -2-Ct-1-2	845/(757)	Histiocytic sarcoma	
γ -2-Ct-1-3	848/(760)		
γ -2-Ct-1-4	882/(794)		
γ -2-Ct-1-5	882/(794)	Histiocytic sarcoma	
γ -2-Ct-1-6	897/(809)		
γ -2-Ct-2-3	927/(839)	Histiocytic sarcoma	
γ -2-Ct-2-4	963/(875)	Lymphoma ?	
γ -2-Ct-2-5	994/(906)		
γ -2-Ct-2-6	1015/(927)		Mammary adenoma
γ -5-Ct-1-1	526/(438)	Thymic (T-) Lymphoma	
γ -5-Ct-1-2	561/(473)	Myeloid Leukemia	
γ -5-Ct-1-3	700/(612)	Lymphoma ?	
γ -5-Ct-2-1	737/(649)	Thymic Lymphoma	
γ -5-Ct-1-4	767/(679)		
γ -5-Ct-2-2	827/(739)		
γ -5-Ct-1-5	837/(749)		
γ -5-Ct-2-3	897/(809)		
γ -5-Ct-1-6	902/(814)		
γ -5-Ct-2-4	921/(833)	meta.SC fibrous histiocytoma	
γ -5-Ct-2-5	960/(872)	Lymphoma	
γ -5-Ct-2-6	970/(882)		Pulmonary adenocarcinoma

Control Groups for γ -3 & γ -6(BC3)

Animal ID	Survival (day)	Histopathology	
		Fatal Tumors	Other Tumors
γ -3-Ct-2-1	745/(657)		Mam.adenocarcinoma
γ -3-Ct-2-2	756/(668)		Hemangioma
γ -3-Ct-2-3	792/(704)	Lymphoma	
γ -3-Ct-2-4	800/(712)		
γ -3-Ct-1-1	891/(803)	Lymphoma	
γ -3-Ct-1-2	952/(864)	Lymphoma ?	
γ -3-Ct-1-3	1016/(928)	Lymphoma	
γ -3-Ct-1-4	1072/(984)		
γ -3-Ct-1-5	1093/(1005)		SC Hemangiosarcoma
γ -3-Ct-1-6	1134/(1046)	Lymphoma ?	SCT ?
γ -3-Ct-2-5	1138/(1050)		SC Hemangiosarcoma
γ -3-Ct-2-6	1178/(1090)	Lymphoma ?	
γ -6-Ct-2-1	685/(598)	Myeloid leukemia	
γ -6-Ct-1-1	772/(685)	Lymphoma	
γ -6-Ct-1-2	839/(752)	Lymphoma	
γ -6-Ct-1-3	856/(769)	meta.Mam.squamous cell Ca	
γ -6-Ct-1-4	860/(773)		
γ -6-Ct-2-2	875/(788)		
γ -6-Ct-1-5	896/(809)	Lymphoma	
γ -6-Ct-2-3	944/(857)	Lymphoma?	
γ -6-Ct-2-4	1028/(941)		Mam.adenocarcinoma
γ -6-Ct-1-6	1070/(983)	Lymphoma	Mam.adenoma
γ -6-Ct-2-5	1077/(990)	Pulmonary adenocarcinoma	SC fibrosarcoma
γ -6-Ct-2-6	1210/(1123)	Lymphoma	SC fibrosarcoma

Groups of γ -Irradiated Animals

The experimental groups of whole-body γ -irradiated animals as listed below include the Groups γ -1 to γ -6 of three strains of mice, and the information on the experimental regimens including the age of animals at irradiation and the total doses, is attached to the head of the table for each group, respectively.

Group γ -1 (C3H)
 [Age at irradiation: 85 days/Total doses: 1.0-3.0 Gy]

Non-Neoplastic Lesions from the Groups of γ -Irradiated and Control Animals

Histopathological findings on non-neoplastic lesions from the experimental groups of γ -irradiated and control animals (Groups γ -1 to γ -6 of three strains of mice) are summarized for individual cases. The tables as below contain the information on the dose, survival period, and histopathological diagnosis of non-neoplastic lesions and neoplasms in each case.

Group γ -1 (C3H)

4. Lists for Histological Specimens of Neoplasms from Individual Animals

4.1 Lung Tumors from Rats

The following tables list up the selected specimens prepared for histopathological and immunohistochemical examinations of rat primary lung tumors obtained from both the experiments for inhalation exposures to $^{239}\text{PuO}_2$ aerosols (Groups A to B') and X-irradiation (Groups X-1 to X-15). These include the paraffin-embedded blocks, histological sections on glass slides stained with hematoxylin-eosin and others for immunohistochemistry, MO disc files of microscopic pictures, established cell lines and DNA samples, respectively together with the information of individual animal case of lung tumors.

4.1.1 Paraffin-Blocks

The selected paraffin-blocks of primary lung tumors from individual animals are put in a sealed plastic bag, stored in a bundle of the groups in the box. The following tables list the information of case number, survival period, initial lung deposition and lung dose for $^{239}\text{PuO}_2$ -exposures or total dose for X-irradiation, and histopathological diagnosis of lung tumors of the individual animals as well as the number (#) of the container box.

4.1.2 Histological Sections

The selected histological section slides of primary lung tumors from individual animals are put in a plastic box as indicated by the number. The following tables list the information of case number, survival period, initial lung deposition and lung dose for $^{239}\text{PuO}_2$ -exposures or total dose for X-irradiation, and histopathological diagnosis of lung tumors of the individual animals as well as the number (#) of the slide box.

4.1.3 Digital Pictures

The selected microscopic pictures of primary lung tumors from individual animals are saved as digital pictures in the folder of the MO disc files as indicated. The following tables list the information of the file name, object, staining, power magnification, histopathological diagnosis of the lung tumor specimens, as well as initial lung deposition and lung dose for $^{239}\text{PuO}_2$ -exposures or total dose for X-irradiation, and survival period of the individual animals, in each MO disc file.

4.1.4 Cell Lines and DNA Samples

The trials for establishment of lung tumor cell lines available for cell cultures and *in vitro* studies resulted in one line, PuD2, obtained from an adenocarcinoma lesion in the $^{239}\text{PuO}_2$ -exposed rat (case # D-2-1-2). This line has been demonstrated to be derived from surfactant apoprotein A-positive type II pneumocytes and have a doubling time of about 20 hr in cultures after several passages, showing an appearance of compact solid carcinomas *in situ* in subcutaneously injected nude mice.

The following table includes cell lines established from rat tracheal or pulmonary epithelium, available for *in vitro* studies as well as transplantation assays.

List of Rat Tracheal or Pulmonary Epithelial Cell Lines

Cell Line ID	Cellular Origin	Original Source
PuD2	Lung adenocarcinoma from Pu-exposed rat	NIRS
SV40T2	Immortalized type II cells from neonatal rat lung	A.Clement (Univ.Paris)
RTiv3	Gamma-ray-induced transformant from rat tracheal epithelial cells	J.L.Poncy (DRR/CEA)
BP	<i>In utero</i> benzo [a] pyrene-induced epithelial cells from fetal rat lung	E.May (DRR/CEA)
BP(P)Tu	BP-derived & tumorigenic cells	E.May (DRR/CEA)
BP130	BP-derived & cultured cells	E.May (DRR/CEA)
BP270	BP-derived & cultured cells	E.May (DRR/CEA)

Characterization of Rat Tracheal or Pulmonary Epithelial Cell Lines

Cell Line	CE (1)	Anchorage Dependent Cell Growth (2)	Tumorigenicity (3)	p53 Genome	p16 Genome (4)	Expression of p16 mRNA (5)	p16 Methylation (6)
PuD2	73	Independent	++	Wild type	Deletion	-	-
SV40T2	39	Dependent	-	Wild type	+	+	U
RTiv3	14	Dependent	-	Wild type	+	-	M
BP	75	Independent	+	Wild type	+	+	UM
BP(P)Tu	76	Independent	+	Codon 130 AAG to AGG	+	-	M
BP130	ND	Independent	+	Codon 130 AAG to AGG	+	-	M
BP270	ND	Independent	+	Codon 270 GTT to TTT	+	-	M

(1) Colony efficiency in liquid culture, number of colonies per 100 cells, ND; not done

(2) Cell growth in agarose culture medium

(3) Cell growth in nude mouse

(4) Amplified by PCR of genomic DNA

(5) Amplified by RT-PCR of cDNA

(6) U; unmethylated, M; methylated, -; not amplified by methylation specific PCR

The following table includes genomic DNA samples extracted from fresh lung tumor lesions of $^{239}\text{PuO}_2$ -exposed rats, available for analyses on tumor-related gene alterations.

List of Genomic DNA Samples from Lung Tumors of Pu-Exposed Rats

Animal ID	Histopathological Diagnosis	Remarks for <i>p53</i> (Exon 5-8) Mutations

4.2 Bone Tumors from Mice

The following tables list up the selected specimens prepared for histopathological and immunohistochemical examinations of the primary bone tumors obtained from the experiments for injections of ^{239}Pu citrate solution in three different strains of mice (Groups IP7 to IP14). These include the paraffin-embedded blocks, histological sections on glass slides stained with hematoxylin-eosin and others for immunohistochemistry, MO disc files of microscopic pictures, established cell lines and DNA samples, respectively together with the information of individual animal case of bone tumors.

4.2.1 Paraffin-Blocks

The selected paraffin-blocks of primary bone tumors from individual animals are put in a sealed plastic bag, stored in a bundle of the groups in the box. The following tables list the information of case number, mouse strain, injected dose and skeletal dose, survival period, and histopathological diagnosis of bone tumors of the individual animals as well as the number (#) of the container box.

4.2.3 Digital Pictures

The selected microscopic pictures of primary bone tumors from individual animals are saved as digital pictures in the folder of the MO disc files as indicated. The following tables list the information of the file name, object, staining, power magnification, histopathological diagnosis of the bone tumor specimens, as well as the strain, injected dose and survival period of the individual animals, in each MO disc file.

4.2.4 Cell Lines and DNA Samples

The trials for establishment of bone tumor cell lines available for cell cultures and *in vitro* studies resulted in one line, mOS, obtained from an osteosarcoma lesion in the ^{239}Pu -injected mouse (case # IP14-2-9). This line has been demonstrated to show an appearance of spindle-shaped osteoblasts or partly tartaric acid-resistant acid phosphatase (TRAP)-positive multinucleated giant cells (osteoclasts) with a doubling time of about 50 hr in cultures, and after a long-term cultures for several months, the cells were available for transplantation tumorigenesis assays using nude mice.

The following table includes genomic DNA samples extracted from fresh bone tumor lesions of ^{239}Pu -injected mice, available for analyses on tumor-related gene alterations.

List of Genomic DNA Samples from Bone Tumors of Pu-Injected Mice

Animal ID	Histopathological Diagnosis	Remarks for <i>p53</i> (Exon 5-8) Mutations	Remarks for K-, H-, N- <i>ras</i> (Exon 1-2) Mutations
IP12-2-4	Osteosarcoma	Wild	Wild
IP12-3-11	Osteosarcoma	Wild	Wild
IP12-3-6	Osteosarcoma	Ex7 codon 245 (CGT to AGC)	Wild
IP12-3-6	Normal	Wild	Wild
IP12-3-9	Osteosarcoma	Wild	Wild
IP13-1-4	Osteosarcoma	Wild	Wild
IP13-2-2	Osteosarcoma	Wild	Wild
IP13-2-3	Osteosarcoma	Wild	Wild
IP13-3-10	Osteosarcoma	Not tested	Not tested
IP14-1-10	Osteoma	Not tested	Not tested
IP14-1-3	Osteosarcoma	Wild	Wild
IP14-2-3	Osteosarcoma	Wild	Wild
IP14-2-9	Osteosarcoma	Not tested	Not tested

4.3 Lymphoid Neoplasms from Mice

The following tables list up the selected specimens prepared for histopathological and immunohistochemical examinations of the lymphoid neoplasms obtained from the experiments for injections of ^{239}Pu citrate solution or saline (Groups IP1 to IP 5 and IP7 to IP14), injections of MNU (MNU-1 to MNU-6), and whole-body γ -irradiation (γ -1 to γ -6) in three different strains of mice, respectively. These include the paraffin-embedded blocks, histological sections on glass slides stained with hematoxylin-eosin and others for immunohistochemistry, and MO disc files of microscopic pictures, respectively together with the information of individual animal case of lymphoid neoplasms.

4.3.1 Paraffin-Blocks

The selected paraffin-blocks of lymphoid neoplasms from individual animals are put in a sealed plastic bag, stored in a bundle of the groups in the box. The following tables list the information of case number, mouse strain, injected dose of ^{239}Pu or total dose of γ -ray, survival period, and histopathological diagnosis of lymphoid neoplasms of the individual animals as well as the number (#) of the container box.

4.3.2 Histological Section Slides

The selected histological section slides of lymphoid neoplasms from individual animal case are put in a plastic box as indicated by the number. The following tables list the information of case number, mouse strain, injected dose of ^{239}Pu or total dose of γ -ray, survival period, and histopathological diagnosis of lymphoid neoplasms of the individual animals as well as the number (#) of the slide box.

**Selected Section Slides from the Groups of Pu-Injected Mice
(IP1 to IP5 & the Controls)**

4.3.3 Digital Pictures

The selected microscopic pictures of lymphoid neoplasms from individual animals are saved as digital pictures in the folder of the MO disc files as indicated. The following tables list the information of the file name, object, staining, power magnification, histopathological diagnosis of lymphoid neoplasms, as well as the strain, injected dose of ^{239}Pu or total dose of γ -ray and survival period of the individual animals, in each MO disc file.
